

JS

VERY VERY BASIC

Helping Material

<https://www.w3schools.com/js/default.asp>

Use it as a reference Guide

Where to write Js

Script Tag

```
<script>  
document.getElementById("demo").innerHTML = "My First  
JavaScript";  
</script>
```

Or Make a separate Js file and attach like below

```
<script src="/js/myScript1.js"></script>
```

Js Output

Writing into an HTML element, using `innerHTML`.

Writing into the HTML output using `document.write()`.

Writing into an alert box, using `window.alert()`.

Writing into the browser console, using `console.log()`.

First use `console.log()` and `alert` for beginners

JS Can Change HTML

```
document.getElementById("demo").innerHTML = "My First  
JavaScript";
```

JS Can Chane CSS But Dont do it

```
document.getElementById('demo').style.fontSize='35px'
```

JS Can Chane Attributes

```
document.getElementById('myImage').src='pic_bulbon.gif'
```

Hide Un Hide Elements

```
<p id="demo" style="display:none">Hello JavaScript!</p>
```

```
<button type="button"  
onclick="document.getElementById('demo').style.display='block'">Click Me!</button>
```

Put it in HTML Head Section

```
<!DOCTYPE html>
<html>
<head>
<script>
function myFunction() {
    document.getElementById("demo").innerHTML = "Paragraph
changed.";
}
</script>
```

Put it in HTML Head Section

```
</head>
```

```
<body>
```

```
<h2>Demo JavaScript in Head</h2>
```

```
<p id="demo">A Paragraph.</p>
```

```
<button type="button" onclick="myFunction()">Try it</button>
```

```
</body>
```

```
</html>
```

JS Can Also be placed in body sections

```
<!DOCTYPE html>
```

```
<html>
```

```
<body>
```

```
<h2>Demo JavaScript in Body</h2>
```

```
<p id="demo">A Paragraph.</p>
```

```
<button type="button" onclick="myFunction()">Try it</button>
```

```
<script>
```

JS Can Also be placed in body sections

```
function myFunction() {  
    document.getElementById("demo").innerHTML =  
    "Paragraph changed.";  
}  
</script>  
</body>  
</html>
```

Separate File (Recommended)

- `<script src="myScript.js"></script>`

HTML DOM

```
<a name="html">HTML Tutorial</a><br>
```

```
<a name="css">CSS Tutorial</a><br>
```

```
<a name="xml">XML Tutorial</a><br>
```

```
<p id="demo"></p>
```

```
<script>
```

```
document.getElementById("demo").innerHTML =
```

```
"Number of anchors are: " + document.anchors.length;
```

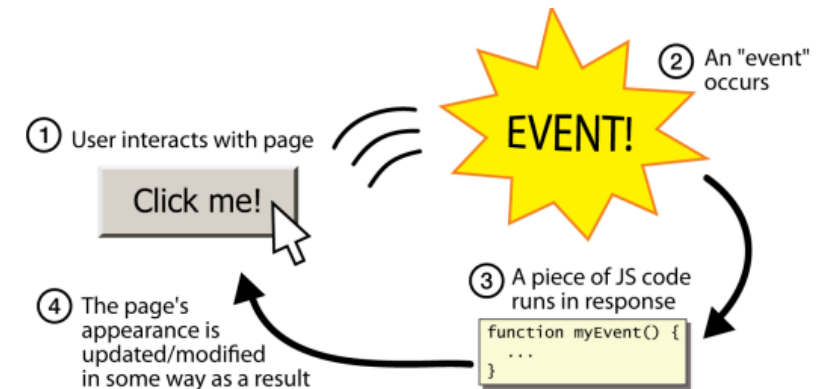

```
</script>
```

Event Driven Programming

You are used to programs start with a main method (or

implicit main like in Java)

Some programs instead wait for user actions called events and respond to them

Event Handlers

JavaScript functions can be set as event handlers

- When you interact with the element, the function will execute

onclick is just one of many event HTML attributes we'll use

Event handlers never execute until the events they handled occur

<code><element attributes onclick="function() ;">...</code>	HTML
<code><button onclick="myFunction() ;">Click me!</button></code>	HTML
	output

DOM Document Object Model

A set of **JavaScript objects** that represent each element on the page

- Most JS code manipulates elements on an HTML page
- We can examine elements' state
 - e.g. see whether a box is checked
- We can change state
 - e.g. insert some new text into a div
- We can change styles
 - e.g. make a paragraph red

DOM Element

- Every element on the page has a corresponding **DOM** object

- Access / modify the attributes of the **DOM** object with *objectName.attributeName*

- In fact, browsers evaluate a Web page into corresponding **DOM** objects at runtime

HTML

```
<p>  
  Look at this octopus:  
    
  Cute, huh?  
</p>
```

DOM Element Object

Property	Value
tagName	"IMG"
<u>src</u>	"octopus.jpg"
alt	"an octopus"
id	"icon01"

JavaScript

```
var icon = document.getElementById("icon01");  
icon.src = "kitty.gif";
```

```
var name = document.getElementById("id");
```

JS

```
<button onclick="changeText();">Click me!</button>  
<span id="output">replace me</span>  
<input id="textbox" type="text" />
```

HTML

```
function changeText() {  
    var span = document.getElementById("output");  
    var textBox = document.getElementById("textbox");  
    textBox.value = span.innerHTML;  
    span.innerHTML = "Hello, how are you?";  
}
```

JS

Click me! replace me

output

What will Happen Here

Name	Description
<u>document</u>	current HTML page and its content
<u>history</u>	list of pages the user has visited
<u>location</u>	URL of the current HTML page
<u>navigator</u>	info about the web browser you are using
<u>screen</u>	info about the screen area occupied by the browser
<u>window</u>	the browser window

Global DOM Objects

The window Object

The entire browser window; the top-level object in DOM hierarchy

Technically, all global code and variables become part of the window object

Properties:

- document, history, location, name

Methods:

- alert, confirm, prompt (popup boxes)
- setInterval, setTimeout clearInterval, clearTimeout (timers)
- open, close (popping up new browser windows)
- blur, focus, moveBy, moveTo, print, resizeBy, resizeTo, scrollBy,

The document Object

The current web page and the elements inside it

Properties:

- anchors, body, cookie, domain, forms, images, links, referrer, title, URL

Methods:

- getElementById
- getElementsByName
- getElementsByTagName
- close, open, write, writeln

The location Object

The URL of the current web page

Properties:

- host, hostname, href, pathname, port, protocol, search

Methods:

- assign, reload, replace

The navigator Object

Information about the web browser application

Properties:

- appName, appVersion, browserLanguage, cookieEnabled, platform, userAgent

The screen Object

Information about the client's display screen

☐ Properties:

- availHeight, availWidth, colorDepth, height, pixelDepth, width

The history Object

The list of sites the browser has visited in this window

Properties:

- length

Methods:

- back, forward, go
